# CHILDREN'S MATHEMATICAL LEARNING

## **CML Book**

The CML book is an online book about how children learn mathematics. Children's Mathematical Learning (CML) was originally designed as a supplement for elementary mathematics education courses including content, methods, and graduate courses. However, parents have also found the materials beneficial. The CML book has descriptions about how children learn math and there are also problems for children to solve. Most problems have data on what percent of children had the problem correct and on how other children solved the problem. The books and the CML project is based on the premise that knowledge of how children learn mathematics will enhance students learning of mathematics-make math more meaningful, and will enhance teachers' ability to teach math to children.

This book was previously published by Pearson Education, Inc. as: *Connecting Mathematics for Elementary Teachers, CMET*, (2009).

The Connecting Mathematics for Elementary Teachers Project was funded by the National Science Foundation, grants DUE 0341217 and DUE 0126882. Opinions expressed are those of the authors and not necessarily those of the National Science Foundation.

## Other Resources

### CML Videos

CML Videos are short video clips of children engaged in mathematical thinking. These videos are designed to illustrate how children learn and think about mathematics. The development of these videos is funded by National Science Foundation grant (DUE 122942). The videos show children in grades K-5 solving mathematical problems. Each video is accompanied by narrative at the beginning, often between clips, and at the end to help viewers focus on how children learn mathematics.

CML videos look at how children learn mathematics in depth. Our videos attempt to show how children think mathematically and how understanding this thinking is a crucial part of teachers' and parent's efforts to further student learning. Our intent is to help viewers realize how several children might solve the same problem. In the third grade video  $6 \times 8$  we attempt to illustrate how children use a variety of methods to solve multiplication problems (See CML video: Multiplication  $6 \times 8$ ). It is not just an isolated example illustrating the *complexity* of children's mathematical thinking, but rather a series of examples of how children actually learn concepts like multiplication. In CML we typically show several children using different methods solving the same problem. Our intent is for viewers to see the multiple ways that children think. A second key feature is the narration with each video. The narration is designed to focus the viewers' attention on what aspects are important in how children learn mathematics. The narration between clips gives viewers an opportunity to reflect on each child's mathematical thinking. In contrast to other videos, CML videos have a singular purpose of demonstrating how children learn mathematics.

The videos are **free** and available at [cmlvideos.com](http://cmlvideos.com) and the password is: cmlvideos.

### CML Activities

CML Activities are a collection of math activities we developed over the past 20 years. These are fun math activities designed to help children gain greater mathematical skills in an enjoyable format. Teachers and parents can play the activities with children or children can play with each other. We know that children enjoy doing these activities and that they are learning mathematics. The activities are for sale and are available as a downloadable PDF at [CMLactivities.com](http://CMLactivities.com). These activities are designed to be done with children are intended for readers, teachers and parents, who are working with children.

## **Dedication**

This book is dedicated to children, that they might understand mathematics and to future teachers, that they might understand how children understand mathematics.

<b>Introduction</b>		
<b>Chapter 1</b>	<b>Problem Solving</b>	<b>1</b>
1.1	An Introduction to Problem Solving	1
	What is Problem Solving? • Why do Problem Solving? • Learning to Teach Problem Solving • What is a (Mathematical) Problem for Children? • Children's Beliefs about Solving Problems • How Children Solve Problems • Mathematics Modeling • Problem Solving Steps • Problem Solving Strategies – Heuristics	
1.2	Patterns	16
1.3	Mathematical Reasoning	20
	Deductive and Inductive Reasoning • Sense-Making • Key Words • Incorporating Writing and Mathematics References	25
<b>Chapter 2</b>	<b>Sets</b>	<b>27</b>
2.1	Set Theory	27
	A Historical Perspective • What is number? • How do Children Develop the Concept of Number • Set Theory Basic Operations • Reasons for Studying Set Theory How do Children Develop the Concept of Number	
2.2	Venn Diagrams	34
	References	39
<b>Chapter 3</b>	<b>Whole Numbers</b>	<b>40</b>
3.1	Numeration Systems	40
	The Need for Numbers • Models of Our Number System • Expanded Notation	
3.2	Addition and Subtraction	47
	One Child's Perspective of Addition • Counting Types • Counting Based Strategies • Concept of Ten and Place Value • Thinking Strategies and Learning "Basic Facts" • Subtraction/Take-Away • Two Levels of Difficulty for Subtracting in Context	
3.3	Multiplication and Division	50
	Multiplication • From Additive to Multiplicative Thinking • Cartesian Products • Multiplication Thinking Strategies and Basic Facts • How Young Children Divide • Division By and With 0 • Order of Operations	
3.4	Properties of Whole Number Operations	60
	Commutative Property • Associative Property • Distributive Property • Identity Properties • Closure Property	
3.5	Algorithms	65
	Addition and Subtraction Algorithms • Children's Self- Generated Algorithms • Multiplication Algorithms • Division algorithms	
3.6	Mental Math & Estimation	81

	References	86
<b>Chapter 4</b>	<b>Number Theory</b>	88
4.1	Factors and Multiples	88
4.2	Divisibility Tests	90
4.3	Prime and Composite Numbers	92
4.4	Greatest Common Factor & Least Common Multiple	94
	References	97
<b>Chapter 5</b>	<b>Integers</b>	98
5.1	Children’s Understanding of Negative Numbers Number Line Representation • Number as a Quantity Representation • Children’s Use of Negative Numbers in Algorithms • Children’s Understanding of Negative Numbers in a Different Context	98
5.2	Addition and Subtraction of Integers Parentheses • Number line • Black and Red Chip Model • Absolute Value	102
5.3	Multiplication and Division of Integers How Children Solve Some Integer Word Problems References	106 109
<b>Chapter 6</b>	<b>Rational Numbers - Fractions</b>	110
6.1	Fractions Fraction as a Part-whole Relationship • Fraction as a Quotient • Fraction as a Location on a Number Line or as a Measure • Fraction as a Ratio • Fraction as an Operator • Equivalent Fractions • Improper Fractions • Common Misconceptions with Fractions	110
6.2	Addition and Subtraction of Fractions Models for Adding and Subtracting Fractions • Common Misconceptions Adding and Subtracting Fractions	127
6.3	Multiplication and Division of Fractions Models for Multiplying and Dividing Fractions • Common Misconceptions Multiplying and Dividing Fractions	131
6.4	Properties of Rational Numbers Correspondence of Rational Numbers and Points on the Number Line References	138 140
<b>Chapter 7</b>	<b>Decimals, Percents, and Real Numbers</b>	142
7.1	Place Value	142
7.2	Decimals A Foundation for Decimal Understanding • Models for Decimal Numbers • Rounding Decimal Numbers • Children’s Understanding of Decimals • Scientific Notation	145
7.3	Decimal Computation Lining up the Decimal Points • Counting the Number	153

	of Decimal Places in the Factors when Multiplying Decimals • Moving the Decimal Point in the Dividend and the Divisor when Dividing • More on Decimal Computation • Partial Sums of Decimals	
7.4	Ratio and Proportion Unit or Unit Rate Method • Scale Factor or Composite Unit Rate • Building-Up • Cross Multiplication • Rate, Ratio, and Scale Factor • Proportional Reasoning	158
7.5	Percents Children's Knowledge of Percents • Mental Computation with Percents	165
7.6	Rational, Irrational, and Real Numbers	169
	References	169
<b>Chapter 8</b>	<b>Geometry</b>	172
8.1	Basic Geometric Concepts Geometry in Elementary School • Concept Image • van Hiele Levels • Points, Lines, and Planes • Congruence • Parallel and Perpendicular Lines	172
8.2	Basic Shapes Shapes • Convex • Shapes, Interior, and Exterior • Triangle • Rectangle • Parallelogram • Invariance of Shape • Computer Tools	179
8.3	Angles Angle Measurement • Supplementary and Complementary Angles • Common Problems Children Have Measuring with a Protractor	189
8.4	Proof/Mathematical Reasoning/Justification/Argumentation The Sum of the Measures of the Angles of a Triangle	197
8.5	Three-Dimensional Geometry What is Important in Three-Dimensional Geometry • Prisms • Euler's Formula • Mobius Strips	202
	References	207
<b>Chapter 9</b>	<b>More Geometry</b>	210
9.1	Transformations or Rigid Motions More on Congruence • Tessellations • Vertical Angles and Parallel Lines Cut by a Transversal	210
9.2	Constructions	215
9.3	Symmetry	217
9.4	Similarity What is Trigonometry?	221
	References	226
<b>Chapter 10</b>	<b>Measurement</b>	228
10.1	The Concept of Measurement Measurement as a Developmental Process • The Metric System	228
10.2	Linear Measurement	234

	Key Concepts of Measurement • The Teaching of Linear Measurement	
10.3	Area and Perimeter	243
	Perimeter • The Concept of Area • Children’s Common Misconceptions about Area • Mud Puddle Problem • Key Concepts of Area • The Teaching of Area Measurement • Area Formulas • Area of a Circle	
10.4	Volume and Surface Area	262
	Surface Area of a Three-dimensional Figure	
10.5	Time	267
	References	269
<b>Chapter 11</b>	<b>Statistics/Data Analysis</b>	272
11.1	Data Analysis and Statistical Graphs	272
	Statistical Graphs	
11.2	Statistical Deceptions and Examining Statistics Critically	283
11.3	Mean, Mode, and Median	288
	Mode • Ideal Average • Midrange • Median • Mean	
11.4	Variation or Spread	294
11.5	Statistical Samples	297
	Randomness • Normal Distribution	
	References	299
<b>Chapter 12</b>	<b>Probability</b>	302
12.1	Basic Notions of Probability	302
	The Ratio Concept • Chance • Intuitive Understanding of Probability • Equal Likely Outcomes • Simulations • Randomness • Sample Space	
12.2	More Sophisticated Concepts of Probability	315
	Multistage Probability • Independent and Dependent Events • Mutually Exclusive Events • Expected Value • Odds	
	References	321
<b>Chapter 13</b>	<b>Algebraic Reasoning</b>	323
13.1	The Concept of Variable	324
13.2	Algebraic Reasoning: Generalizing	329
	Generalizing a Specific Problem • Generalizing a General Principle or Property	
13.3	Generalizing with Two Variables – Functions	339
13.4	Graphing: Coordinate Geometry	343
13.5	The Concept of Equality	347
	References	349
	Answers to Problems and Exercises	325
	Index	332

# Introduction

To the student<sup>1</sup>:

Children's Mathematical Learning (CML) materials are designed to be a supplement for a variety of elementary mathematics education courses including content, methods, and graduate courses. These materials have been designed to help you connect **your own learning of mathematics** with **how children understand and learn mathematics**. In addition, the CML Supplement attempts to show how children's learning of mathematics in elementary school is connected to more advanced mathematics in middle and high school. Consequently, this supplement primarily focuses on how children learn and understand mathematics and not on how to teach mathematics. While this supplement is not designed to teach you how to teach mathematics to children, we believe that learning how children think mathematically will be helpful in your teaching of mathematics to children.

Every child is different. Our descriptions of how many or most children learn are not a guarantee of how every child thinks mathematically. The best way to find out what a child is thinking is to ask him/her. The CML Supplement attempts to provide general descriptions of children's learning. These descriptions are intended to help you understand how children approach mathematics differently than adults. By helping you connect children's thinking to your own learning, we hope that this will improve your understanding of both mathematics and children thereby enhance your ability to teach mathematics to children.

As you use this supplement, try to consider how you learned mathematics, how children learn mathematics, and how you will teach mathematics to children. The more you understand mathematics and how children think about mathematics, the better teacher you will be. Our advice is:

- Read the supplement along with your textbook,
- Do the Problems and Exercises, and
- Try to understand how children learn mathematics.

## Organization

---

<sup>1</sup> Note: Throughout the supplement, **student** refers to you, a preservice elementary teacher or graduate student, and **child** refers to an elementary school student.

Each section contains insights and examples of how children come to understand mathematics. Many of the descriptions of how children learn are based on research, but some are based on the authors' personal experiences with helping children learn mathematics. We have attempted to use our own knowledge and experiences along with research to present descriptions of how children understand the mathematics. We have also attempted to describe the "why" behind the mathematics that you will be teaching to children because, as a teacher, you should be able to explain the mathematics to children. Key underlying, mathematical concepts are presented and discussed. Manipulatives are discussed in relationship to the mathematics children are learning. As a teacher, it is important to understand the mathematics that a manipulative represents or embodies. Occasionally, a few class activities are included to help you see how children think mathematically. Connections are made to children's later developments in mathematics, which might include the mathematics that children will learn in later grades or even middle or high school. In summary, the CML Supplement attempts to connect the mathematics you are learning with the mathematics you will be teaching children.

At the end of each section are "**Problems and Exercises**" for you to solve. These problems and exercises are different than the problems in your mathematics textbook in that they are specifically designed to help you learn how children learn mathematics. Many of these questions are from the National Assessment of Educational Progress (NAEP) and the Third International Mathematics and Science Study (TIMSS). The NAEP tests are only given in the United States and are used to measure national achievement. The TIMSS tests are given in the United States and internationally and used primarily to compare mathematics achievement in the United States with other countries. Both these tests are normally given every two to four years and are used to measure the educational achievement in mathematics in grades 4, 8, and 12. The test questions along with the performance data of children on the test questions are available at the following websites:

NAEP: <http://nces.ed.gov/nationsreportcard/itmrls/>  
TIMSS: <http://timss.bc.edu/timss2003i/released.html>  
[http://timss.bc.edu/timss1999i/timss\\_test.html](http://timss.bc.edu/timss1999i/timss_test.html)  
<http://timss.bc.edu/timss1995i/Items.html>

Another key feature of this supplement is “**Children’s Solutions and Discussion of Problems and Exercises**” section. Here we present both children’s solutions and errors or a discussion for some of the “**Problems and Exercises**”. With the NAEP and TIMSS questions, we give the percentage of children who had the correct solution. With some NAEP questions we also give children’s actual solutions. All the data we present may not be indicative of how a particular child or class will perform on the problem. The data is intended to provide a general idea on how many children perform on similar problems.

Before looking at the “**Children’s Solutions and Discussion of Problems and Exercises,**” be sure to do the problems first and then see how children attempted them. Especially consider what mathematics you will need to understand in order to understand and facilitate children’s growth in learning mathematics. To help you reflect on these connections and understandings, each section also has “**Questions for Discussion**”. These are general questions for you to discuss, write about, or reflect upon.

Connections to video clips are interspersed throughout the book. The video icon is an indication that a CML video is related to the topic being discussed. Short questions to consider about the video are also included. The videos are **free** and available at [cmlvideos.com](http://cmlvideos.com) and the password is: cmlvideos. We encourage you to take some time to watch each video when you see the video icon.

We sincerely hope that you enjoy using CML and find it useful in your learning of mathematics. More importantly, we hope that CML allows you to make important connections to the ways that children learn and think about mathematics.

## Preface to the Instructor

Children’s Mathematical Learning (CML) is designed to be used with any course and textbook for the mathematical content or methods courses for elementary teachers. We have developed alignment tables that show how CML is aligned with the most widely used textbooks in mathematics education. The tables for textbooks published by Pearson can be found in the CML Instructors Guide and all available tables can be found on our website:

<http://www.childrensmathematicallearning.com>

### Purpose of CML

CML is not specifically designed to teach mathematics, but to help preservice teachers connect the mathematics they are learning with how children learn and understand mathematics. The intent is that this will enhance preservice teachers’ understanding of mathematics and consequently improve their future teaching of mathematics to children. Students are more motivated to learn when they can see the connection between their learning and their future profession.

### Using CML

We have two main suggestions in effectively using CML. First, having students read CML is essential; consider assigning the reading of the CML section along with the corresponding section that you are covering in the mathematics content textbook. You may assign some or all of the **Problems and Exercises** at the end of each section. These problems are designed for children; some are eighth grade problems so a few may be a bit more challenging. Most answers are in the back of the book. Encourage students to solve these problems first. However, the key is the **Children’s Solutions and Discussion of Problems and Exercises**. So, the second main suggestion is to, whenever possible, discuss or cover the data and children’s solutions from this section with your students. The data and solutions are designed to provide insights into how children understand mathematics. The **Questions for Discussion** may be more useful in a methods or graduate course in mathematics education.

These are a few suggestions for using CML. We would be interested in learning how others have used our book, especially in methods and graduate mathematics education courses. You can email your comments and suggestions to [dfeikes@pnc.edu](mailto:dfeikes@pnc.edu).

### CML and Students

Most students in mathematical content courses for elementary teachers are apprehensive about learning mathematics. Our hope is that preservice teachers not only learn mathematics, but that they begin to develop an understanding of how children think about mathematics, learn to appreciate mathematics, and enjoy teaching it.

With CML, students should never say, “Where will I ever use this?”

## Acknowledgements

We would first like to thank our wives, Julie (Feikes) and Lisa (Schwingendorf). We could not have written this book without their support and encouragement. Second, our own children, Jaime, Mike, Katie, Andrew, Aaron (Feikes), and Jessica, Ryan, Jeff, and Karen Teller (Schwingendorf) who helped us learn how children think. We acknowledge their contribution to our understanding of how children learn and come to understand mathematical concepts.

Many have contributed to this book - some in small ways and some in large ways. We would like to thank research consultants Paul Cobb, David Tall and Grayson Wheatley for their insightful comments and encouragement and Mary Jane Eisenhauer, Michelle Stephan and Marcela Perlwitz for their contributions, as well as David Pratt and Sarah Hough for their extensive evaluation and help in refining the book, and Teresa Henning for her thoughtful editing of the manuscript. David Pratt is also responsible for putting our work online and moving us forward into the digital age.

We would also like to thank Anne Brown, Carol Steiner, Carol Castellon, Barbara O'Donnell, Ann Taylor, and Danny Breidenbach for piloting our materials; Nancy Brinklow, Sara Sightes, and Diane Kilkenny for their reading of the materials; Nadine Kost for the creation of our first cover logo, and our secretaries Gwen Vernich, Stephanie Jimenez, Diedre Combs, and Kay Toll for their help in the preparation of the manuscript.

Many undergraduates have helped in the collection of data included in the book including: Melanie Hoffman, Deana Sommers, Carol Kurmis, Jaime Smith, Salina Thomason, Julie Crawford, Tara Sobecki, Sarah Sims, Amy Hardesty-Asher, Stephanie Koehl, Tamara Trajkovski, Sarah Briggs, Camellia Dabagia, Dana Lippelt, Kristen Pawlik, Susanna Rownd, Crystal Ridley, Alyssa Buechley, Samantha Babb, Ray Callahan, Chris Goodwin, Julie Hanaway, Kim Holt, Jill Posiadlik, Kristin Richardson, Abby Vanlaningham, David Demmon, Becky Welter, Ian Pappas, Becky Lane, Carrie Miller, Kelly Harmon, Moniqua Neal, Maria Yovino, Brett Parks, LouAnn Tuttle, Heather Walters and Ashley Davis.
